Introduction
On September 17, 2014, the United States Department of Agriculture (USDA), Farm Service Agency (FSA) announced additional support for commercial Florida citrus growers to manage greening (USDA/FSA 2014). To qualify as a commercial operation, the grower must market the fruit. Farm Service Agency support is in the form of an expanded Tree Assistance Program (TAP). The original program assisted growers in the event the loss occurred within a single year due to a natural disaster such as a hurricane. The expanded TAP recognizes citrus greening (Huanglongbing, or HLB). The program provides growers cost-sharing financial assistance to replace trees that meet a mortality criterion within a time period of up to six years.

The starting date of the expanded TAP is retroactive to October 1, 2011. The deadline for submitting an application for cost-sharing assistance on expenses of trees pulled between October 1, 2011 and December 31, 2014 depends on the year in which the grower applies. For example, if the grower applies for assistance for 2015—say, for cumulative losses from 2013 and 2014—the deadline is 90 calendar days after December 31, 2014. For 2015 and subsequent years, growers need to apply within 90 calendar days of the disaster event, or the date the loss became apparent.

TAP Eligibility
The Tree Assistance Program is available for individuals or legal entities with an average annual adjusted gross income (AGI), during the last three years, of $900,000 or less. Adjusted gross income refers to taxable income; that is, gross income minus adjustments such as farm expenses and personal deductions and exemptions. Below we provide a rough approximation of the maximum acreage that a grower who produces oranges for the juice market would need to earn, at most, an annual AGI of $900,000. However, our calculations are for illustration purposes only and do not apply to any single operation. Therefore, we advise growers to consult their accountants or tax specialists to check whether their operation actually meets the established AGI limit.

We estimate the size of an operation potentially eligible for the expanded TAP by making several assumptions. We begin by using USDA’s latest figures for acreage and production of oranges for 2013/14. These figures are 418,900 bearing acres (USDA/NASS, 2014a) and 104.6 million boxes (USDA/NASS, 2014b), respectively. The resulting average production per acre is 250 boxes. We use this
The calculation for TAP payments is the lesser of the following:
1. Payment is 65 percent of the actual cost of replanting and 50 percent of the actual cost of site preparation
2. The maximum eligible amount established for each individual practice by FSA

In addition, payments are subject to a mandated sequestration (i.e., reduction) of 7.3 percent. Table 2 shows an example of TAP payment calculations for replacing one tree, assuming the requirement for 15 percent mortality plus 3 percent adjustment has been fulfilled. Note FSA will examine each practice individually for computing payments.

Other payment considerations include the following:
1. An annual cap of 500 acres has been established on the cumulative total quantity of acres for which a grower can receive TAP payments.
2. The total payments under TAP will be capped to a maximum of $125,000 per individual or legal entity per application.
3. There will be no partial payments (e.g., growers will not receive a partial payment after site preparation is complete; they will only receive a single payment after resets are planted).
4. Resets planted under TAP that are infected by greening are not re-eligible for cost-sharing assistance due to greening for another six years.
5. The new types of trees planted may differ from those replaced if the new types have the same general end use, as determined and approved by the FSA County Committee.
6. All approved practices must be completed by the grower within 12 months of the approval of the TAP application by the FSA.
7. The cost-sharing program is “one-for-one,” which means that it calls for replacing a tree with a single tree. If the grower replaces a tree with two or more trees to increase density, the program will only cost share one tree.
8. There will be no financial assistance for abandoned groves.

Below is an example for the calculation of the payment’s trigger based on a single grove acre.
**Trigger**

To qualify for assistance, the program requires the stand to sustain cumulative tree mortality over 15 percent due to greening, adjusted by a normal mortality rate of 3 percent, that is, a total of 18 percent. Assuming there are 100 trees in our single acre, cost-sharing payments will be triggered when the number of trees to be replaced is greater than 18 (=100 x 18 percent).

**Cost-Sharing Payments**

Assuming a total of 28 trees needs to be replaced in our hypothetical grove, the expanded TAP will provide cost sharing for the expenses related to the replacement of 23 trees (=28 x [100 percent–18 percent]). If we further assume the grower in this example has the same costs as those described in Table 2, the TAP cost-sharing payments included in that table for each practice after sequestration are as follows (totals do not add up exactly due to rounding error):

- Resets: $110.87 (=5.20 x 23 x [100% - 7.3%])
- Planting: $36.59 (=1.72 x 23 x [100% - 7.3%])
- Site preparation: $126.65 (=5.94 x 23 x [100% - 7.3%])

In this example, the total TAP payment is $274.10 per acre.

**Summary**

Expansion of TAP will provide Florida citrus growers with cost-sharing payments to replace trees infected with greening that are either biologically dead or no longer commercially viable. TAP takes into account the multi-year effect of the disease and is targeted to small-sized and medium-sized citrus growers. However, any commercial operation meeting the eligibility criteria qualifies for assistance. By cost sharing the expenses related to the replacement of infected trees, the Florida citrus TAP will provide support at the farm-level. However, we expect the effects TAP to also benefit the citrus industry as a whole by helping prevent further downsizing.
